

SYSTEMS AND METHODS FOR CACHING
DATA IN MEDIA-ON-DEMAND SYSTEMS

Cross-Reference to Related Application

[0001] This application claims the benefit of United
5 States Provisional Patent Application Nos. 60/239,377
and 60/270,351, filed on October 11, 2000 and
February 21, 2001, respectively.

Background of the Invention

[0002] The present invention relates to systems and
10 methods for interactive television applications. More
particularly, the present invention relates to systems
and methods for retrieving non-on-demand media data and
on-demand media data from separate data sources in an
interactive television application system.

15 [0003] Cable, satellite, and broadcast television
systems provide users with a large number of television
channels. Users have traditionally consulted printed
television program schedules to determine the programs
being broadcast at a particular time. More recently,
20 interactive electronic television program guides have
been developed that allow television program
information to be displayed on a user's television.

[0004] Interactive television program guides are
typically implemented on television set-top boxes.

Such program guides allow users to view television program listings in different display formats. For example, a user may instruct the program guide to display a grid of program listings organized in a channel-ordered and time-ordered array. Users may also search and sort program listings by theme (e.g., movies, sports, etc.) or by title (e.g., alphabetically). A user may obtain additional information for a particular program listing, and may purchase a program for viewing.

[0005] Some interactive program guide systems may provide listings for on-demand videos. In some systems, the on-demand video listings are provided from a data source that is separate from the source that provides listings and other information for non-on-demand media, such as television programs. A video-on-demand server may, for example, provide the listings for on-demand videos to the program guide in-band with or out-of-band from the program guide data or normal television programming. When video-on-demand listings are provided in band, the program guide must establish a connection with the video-on-demand server (if one is not established), and tune the user away from the television program the user is watching in order to retrieve listings. This causes the user to miss part of the programming that he or she is watching. When video-on-demand listings are provided out-of-band, the program guide must also establish a connection with the video-on-demand server (if one is not established), and retrieve the listings. In such approaches, low bandwidth connections may cause unacceptable delays in the display of the video-on-demand listings. In addition, some video-on-demand information, such as new

release listings, is frequently accessed by many users throughout the network. Each user's equipment must establish a session with the server every time information is needed. This may cause huge peak
5 resource demands on the distribution network.

[0006] Accordingly, it would be desirable to provide systems and methods for retrieving non-on-demand media data and on-demand media data from separate data sources in a way that reduces the undesirable
10 consequences associated with current approaches such as, for example, the disruption of the user's viewing experience or delays in displaying application screens.

Summary of the Invention

[0007] The present invention relates to systems and
15 methods for retrieving media data from separate non-on-demand and on-demand media data sources. Illustrative features of some embodiments of the present invention are described, for example, in: U.S. Provisional Patent Application No. 60/239,377, filed October 11, 2000;
20 U.S. Provisional Patent Application No. 60/252,171, filed November 20, 2000; and U.S. Provisional Patent Application No. 60/270,351, filed February 21, 2001 which are hereby incorporated by reference herein in their entirety.

25 [0008] As used herein, non-on-demand media may be any suitable media that is provided to users without a user request. For example, non-on-demand media may be television programs, audio programs, or any other suitable programs. On-demand media may be any suitable
30 media that is provided to users in response to user requests. For example, on-demand media may be on-demand videos or on-demand audio media, downloadable

software, or any other media suitable for on-demand distribution.

[0009] Data for on-demand and non-on-demand media may be any data which describes the media or is
5 associated with the media. For example, non-on-demand media data may be television program titles, additional television program information, television programming advertisements, or pay-per-view ordering information. On-demand media data may be, for example, titles or
10 descriptions of on-demand videos or downloadable software.

[0010] Non-on-demand media data and on-demand media data are retrieved from separate data sources by, for example, an interactive television application such as
15 an interactive television program guide, or other software running on in-home equipment. The on-demand media data may be provided, for example, in-band or out-of-band from the non-on-demand media or non-on-demand media data. In some embodiments, the on-demand
20 media data may be provided as a continuous or periodic data stream using, for example, a carousel-based approach. In other embodiments, the on-demand media data may be provided using a client-server based approach.

[0011] The on-demand media data is automatically
25 retrieved and cached to reduce, for example, system latency or the disruption of the user's viewing experience. Caching the on-demand media data may be staggered in time among users to lessen the peak loads
30 on the network which distributes the on-demand media data. The on-demand media data may be cached, for example, periodically or when the user invokes a particular interface. In some approaches, caching may

2025 RELEASE UNDER E.O. 14176

- be predictive. For example, on-demand media data for features accessible to a user from a given display may be cached. In other approaches, the most popular media on demand data may be cached. In still other
- 5 approaches, the data that is cached may be personalized. For example, user activity may be monitored and the on-demand media may be cached based on the user history. Any other suitable predictive caching may be used.
- 10 [0012] On-demand media data may be retrieved from cache for display. For example, the on-demand media data may be retrieved from cache and displayed in response to a user indicating a desire to access at least the non-on-demand data in, for example, a non-on-
- 15 demand media listings display. In some embodiments, the non-on-demand media listings may be displayed along with on-demand media listings, or other content such as panel or banner advertisements.

Brief Description of the Drawings

- 20 [0013] Further features of the invention, its nature and various advantages will become more apparent from the following detailed description of the preferred embodiments, taken in conjunction with the following drawings, in which like reference characters refer to
- 25 like parts throughout, and in which:
- [0014] FIG. 1 is a schematic block diagram of an illustrative interactive television system, in accordance with various embodiments of the present invention;
- 30 [0015] FIGS. 2-6 show illustrative arrangements for the interactive television application equipment of

FIG. 1, in accordance with various embodiments of the present invention;

[0016] FIG. 7 is an illustrative schematic block diagram of the user television equipment of FIGS. 2-6,
5 in accordance with various embodiments of the present invention;

[0017] FIG. 8 is a illustrative schematic block diagram of portions of the illustrative user television equipment of FIG. 7, in accordance with various
10 embodiments of the present invention;

[0018] FIG. 9 is a flow diagram illustrative of retrieving, caching, and displaying non-on-demand and on-demand data from different data sources in accordance with various embodiments of the present
15 invention;

[0019] FIGS. 10-11 are more detailed flow diagrams of FIG. 9 illustrative of retrieving, caching, and displaying non-on-demand and on-demand data from different data sources in accordance with various
20 embodiments of the present invention;

[0020] FIG. 12 shows an illustrative interactive television application menu display in accordance with various embodiments of the present invention;

[0021] FIG. 13 shows an illustrative interactive
25 television application video-on-demand display in accordance with various embodiments of the present invention;

[0022] FIG. 14 shows an illustrative interactive television application video-on-demand alphabetical
30 movie listings display in accordance with various embodiments of the present invention;

[0023] FIG. 15 shows an illustrative interactive television application video-on-demand individual movie

[0024] FIG. 16 shows an illustrative interactive television application display with video-on-demand

[0025] FIG. 17 shows an illustrative interactive television application display with video-on-demand

[0026] FIG. 18 shows an illustrative interactive television application display with video-on-demand

[0027] FIG. 19 shows an illustrative interactive television application display with video-on-demand

[0028] FIG. 20 shows an illustrative interactive television application display promoting video-on-

Detailed Description of Various Embodiments

[0029] Systems and methods for caching for non-on-
30 demand and on-demand media data from multiple sources
for use in an interactive television application may be
based on any suitable hardware platform or topology.

Suitable hardware may include, for example, satellite receivers, personal computer televisions (PC/TVS), personal computers (e.g., with television tuner cards), cable set-top boxes, or any other suitable hardware.

- 5 **[0030]** In some embodiments, an interactive television application, such as an interactive television program guide, home shopping application or other suitable interactive television application, may run on such hardware. Illustrative interactive
- 10 television program guide systems are described, for example, in Knee et al. U.S. Patent No. 5,589,892 and Knudson et al. U.S. patent application Serial No. 09/357,941, filed July 16, 1999, which are hereby incorporated by reference herein in their entireties.
- 15 Client-server program guide systems are described, for example, in Ellis et al. U.S. patent application Serial No. 09/374,043, filed August 13, 1999, which is hereby incorporated by reference herein in its entirety.
- 20 On-line program guide systems are described, for example, in Boyer et al. U.S. patent application Serial No. 08/938,028, filed September 18, 1997, which is hereby incorporated by reference herein in its entirety.

- [0031]** An illustrative system 100 in accordance with
- 25 one embodiment of the present invention is shown in FIG. 1. Main facility 102 may provide non-on-demand media data from non-on-demand media data source 124 to interactive application equipment 106 via communications path 108. Non-on-demand data source 124
- 30 of main facility 102 may be any suitable computer or computer-based system for generating, storing, or obtaining non-on-demand media data (e.g., manually from an operator, electronically via a computer network or

other connection, or via storage media) and putting the data into electronic form for distribution by main facility 102. In some embodiments, non-on-demand media data source 124 may provide application data in addition to the non-on-demand media data. In other embodiments, main facility 102 may have multiple data sources for providing on-demand media data, non-on-demand media data, and other application data.

[0032] In some embodiments, application data sources may be located at facilities separate from main facility 102, such as at local information service 110, and have their media data provided to main facility 102 via communications path 114 for localization and distribution. Local information service 110 may contain local data source 112. Local data source 112 may be any suitable computer or computer-based system for generating, storing, or obtaining local information data (e.g., manually from an operator, electronically via a computer network or other connection, or via storage media) and putting the data into electronic form for distribution by main facility 102.

[0033] Local information service 110 may be any facility suitable for obtaining data particular to a localized region and providing the data to main facility 102 over communications path 114. Local information data may include, for example, local advertisements, local sports information, local news information, or other suitable local information. Local information service 110 may be, for example, a local weather station that measures weather data, a local newspaper that distributes local news information, or any other suitable provider of information. Main facility 102 may aggregate the

program guide data and local information data and distribute them to interactive television equipment 106.

[0034] Communication paths 108 and 114 may be
5 satellite communications paths, fiber-optic paths, wired communications paths, coaxial cable paths, radio frequency paths, electromagnetic communications paths, microwave communications paths, lightwave paths, Internet paths, a combination of such paths, or any
10 suitable communication paths. Video signals may also be transmitted over paths 108 and 114 if desired.

[0035] Main facility 102 may transmit non-on-demand media data and other application data to interactive application equipment 106 using any suitable approach.
15 For example, main facility 102 may distribute non-on-demand media data periodically, continuously, or with any other suitable frequency. In some approaches, media data may be distributed as files, packets, or as a data stream. Systems in which data is transmitted
20 from a main facility to television distribution facilities using such an approach are described, for example, in Gollahon et al. U.S. patent application Serial No. 09/332,624, filed June 11, 1999, which is hereby incorporated by reference herein in its
25 entirety. There may be numerous pieces or installations of interactive application equipment 106, although only one is shown in FIG. 1 to avoid over-complicating the drawing.

[0036] On-demand media data source 128 may provide
30 on-demand media data, such as video-on-demand information (e.g., titles of on-demand videos, genre information fo on-demand videos, additional information for on-demand videos, and ordering information), audio-

on-demand information (e.g., titles of on-demand audio media, additional information for on-demand audio media, and ordering information), interactive video game or other application information, stock market information, weather information, sports scores, sports statistics, or other suitable on-demand media information, to interactive application equipment 106 over communications link 130. On-demand media data source 128 may be any suitable computer or computer-based system for generating, storing, or obtaining such on-demand media data (e.g., manually from an operator, electronically via a computer network or other connection, or via storage media) and putting the data into electronic form for distribution. On-demand media data source may also provide on-demand media, such as on-demand videos, audio media, or application software.

[0037] Communication path 130 may be a satellite communications path, fiber-optic path, wired communications path, coaxial cable path, radio frequency path, electromagnetic communications path, microwave communications path, lightwave path, Internet path, a combination of such paths, or any suitable communication path. On-demand media may be provided over path 130.

[0038] In other embodiments, on-demand media data may be provided to main facility 102 for transmission to interactive application equipment 106. For example, on-demand media data may be generated at an on-demand media data source (not shown), transmitted to main facility 102, and transmitted to distribution facility 116 (illustrated in FIGS. 2-6) of interactive application equipment 106 via communications path 108.

[0039] An interactive television application may be implemented on interactive application equipment 106. Illustrative arrangements for interactive application equipment 106 are shown in FIGS. 2-6.

- 5 [0040] The interactive television application, such as an interactive television program guide, other guidance application, web browser, or other suitable interactive television application, may run on user television equipment 122 using the arrangements of FIG. 10 2 or FIG. 4, or may run partially on user television equipment 122 and partially on other components of interactive application equipment 106 using a suitable client-server or distributed processing arrangement such as those shown in FIG. 3 or FIG. 5. Distribution 15 facility 116, illustrated in FIGS. 2-6, may be any suitable distribution facility (e.g., a cable system headend, a satellite distribution facility, a broadcast distribution facility, or any other suitable type of distribution facility), and may have distribution 20 equipment 118. Typically, numerous distribution facilities 116 may be included in FIGS. 2-6.

- [0041] Distribution equipment 118 of FIGS. 2-6 may be equipment suitable for providing media data (i.e., on-demand media data and non-on-demand media data) and 25 other application data to user television equipment 122 over communications path 120. In FIG. 6, distribution equipment 118 may provide media data, such as program guide data, to personal computer 140 via Internet service system 134 and suitable communications paths 30 136 and 138.

[0042] Distribution equipment 118 of FIGS. 2-6 may include, for example, suitable transmission hardware for distributing media data and other application data

on a television channel sideband, in the vertical blanking interval of a television channel, using an in-band digital signal, using an out-of-band digital signal, or by any other suitable data transmission technique. Analog or digital signals for non-on-demand media and on-demand media (e.g., television programs, on-demand movies, on-demand music, etc.) may also be distributed by distribution equipment 118 to user television equipment 122 over communication path 120 on multiple television channels.

[0043] In some embodiments, media information may be provided as synchronous metadata. Synchronous metadata is data that is distributed to user television equipment 122 in FIGS. 2-5 or personal computer 140 of FIG. 6 logically at the same time as the media with which it is associated. For example, the synchronous metadata may be supplied contemporaneously with the non-on-demand or on-demand media, or prior to the media data but with information associating it with the data (e.g., identifiers, paths, or any other suitable information). The metadata may be provided in-band, out-of-band, using a carousel-based approach, using a client-server based approach, using localized caching, using a combination of these approaches, or using any other suitable approach.

[0044] The metadata may include other types of data. The metadata distributed to user television equipment 122 of FIGS. 2-5 or personal computer 140 of FIG. 6 may include, for example, commands that indicate to the user's in-home equipment (or client applications running on the equipment) that a particular action is to be performed (e.g., overlaying a visual indicator onto the on-demand media). The metadata may include a

directory that indicates segments of on-demand media data. In some approaches, the metadata may be used as markers within the non-on-demand or on-demand media data. For example, the data may include actor

5 interviews, trailers, selected scenes in a movie, music videos, or any other suitable media data segments. The data segments may be provided along with non-on-demand or on-demand data. Synchronous metadata that is distributed to interactive television applications is

10 described, for example, in U.S. provisional patent application No. 60/239,521, filed October 11, 2000, which is hereby incorporated by reference in its entirety.

[0045] Communication path 120 of FIGS. 2-5 and

15 communication paths 136 and 138 of FIG. 6 may have sufficient bandwidth to allow distribution facility 116 or another distribution facility to distribute television programming to user television equipment 122 of FIGS. 2-5 or personal computer 140 of FIG. 6. There

20 are typically multiple pieces of user television equipment 122 associated with communication paths 120 in FIGS. 2-5, although only one piece of user television equipment 118 and communication path 120 are shown in FIGS. 2-5 to avoid over-complicating the

25 drawings. Similarly, there may be multiple personal computers 140 and multiple associated communication paths (FIG. 6), although only one personal computer 140 and communication path 138 are shown in FIG. 6 to avoid over-complicating the drawings. If desired, non-on-

30 demand media data and on-demand media data may be provided over separate communication paths.

[0046] FIG. 3 illustrates an arrangement for interactive application equipment 106 in a

client-server based or distributed interactive application system. The illustrated client-server based or distributed interactive application systems of FIG. 3 may process non-on-demand media data, on-demand media, data, any suitable combination thereof, or any other suitable data. In some embodiments, non-on-demand media data source 124 (FIG. 1) may be a server that provides non-on-demand media data via communication paths 108 (FIG. 1) and 120 (FIG. 2) to an application client implemented on user television equipment 122 (FIG. 3-5). Distribution equipment 118, as shown in FIG 3, may include server 132. Server 132 may use any suitable combination of hardware and software to provide a client-server based application. Server 132 may, for example, run a suitable database engine (e.g., SQL Server by Microsoft) and provide non-on-demand data, on-demand data, or a combination thereof to an application client implemented on user television equipment 122. For example, server 132 may request or otherwise receive on-demand media data from on-demand media data source 128 (FIG. 1). In other approaches, user television equipment may request or otherwise receive on-demand media data from on-demand media data source 128 (FIG. 1). If desired, server 132 may be located at main facility 102, or other location, such as a cable system headend, a broadcast distribution facility, a satellite television distribution facility, or any other suitable type of television distribution facility.

30 [0047] An application client may retrieve application data from server 132 using any suitable client-server based approach. The client may, for example, pass SQL (structured query language) requests

as messages to server 132. In another suitable approach, the application client may invoke remote procedures that reside on server 132 using one or more remote procedure calls. Server 132 may execute SQL
5 statements for such invoked remote procedures. In another suitable approach, client objects executed by the application may communicate with server objects executed by server 132 using, for example, an object request broker (ORB).

10 [0048] FIGS. 4-5 show illustrative Internet-based interactive television application systems. As shown in FIG. 4, distribution facility 116 may, for example, include Internet service system 134. Internet service system 134 may be any suitable combination of hardware
15 and software capable of providing application data to the application using an Internet based approach (e.g., the HyperText Transfer Protocol (HTTP)). If desired, Internet service system 134 may be located at a facility that is separate from distribution
20 facility 116, as shown in FIG. 5.

[0049] In embodiments where the interactive television application is implemented on user television equipment 122 of interactive application equipment 106 as illustrated in FIG. 4, Internet
25 service system 134 (or other suitable equipment at distribution facility 116 that is connected to Internet service system 134) may provide non-on-demand media data, on-demand media data and other application data to user television equipment 122 via the Internet, or
30 via distribution equipment 118 using any suitable Internet-based approach (e.g., using the HyperText Transfer Protocol (HTTP) over a Transmission Control Protocol/Internet Protocol (TCP/IP) type path). In

embodiments where the interactive television application implemented on interactive application equipment 106 is a client-server based application as shown in FIG. 5, server 132 may obtain on-demand media data and other application data from Internet service system 134. The application may also, however, obtain application data from Internet service system 134 via an Internet connection. In other embodiments, non-on-demand media data source 124, on-demand media data source 128, or a combination thereof may provide media data or other application data to user television equipment via Internet service system 134.

[0050] In another suitable arrangement, distribution equipment 118 may include computer equipment or other suitable hardware on which a first portion or version of the interactive television application is implemented. A second portion or version of the application may be implemented on user television equipment 122. The two versions or portions of the interactive television application may communicate using any suitable peer-to-peer communications scheme (e.g., messaging, remote function calls, etc.) and perform interactive application functions distributively between distribution facility 116 and user television equipment 122.

[0051] Another suitable arrangement in which an on-line application, such as an on-line program guide, may be implemented is on interactive application equipment 106 as shown in FIG. 6. On-line program guide systems are described, for example, in Boyer et al. U.S. patent application Serial No. 08/938,028, filed September 18, 1997, which is hereby incorporated by reference herein in its entirety. The user may have

personal computer 140 on which an application client or web browser is implemented. Personal computer 140 may be connected to Internet service system 134 via path 138, and distribution facility 116 may be connected to
5 Internet service system 134 via path 136. Internet service system 134 may be a communications network or a computer network and may use any suitable combination of computer hardware and software capable of providing an on-line server application or web site. Internet
10 service system 134 is shown as obtaining application data from distribution facility 116. In other suitable approaches, Internet service system 134 may obtain information from other systems such as, for example, main facility 102 (FIG. 1), local information service
15 110 (FIG. 1), non-on-demand media data source 124 (FIG. 1), on-demand media data source 128 (FIG. 1), or any other suitable source of application data.

[0052] An illustrative arrangement for user television equipment 122 is shown in FIG. 7. In some
20 embodiments, user television equipment 122 may receive video or a digital video stream and data from distribution facility 116 (FIGS. 2-6), such as a program distribution facility or some other suitable distribution facility, at input 200. In some
25 embodiments, user television equipment 122 may receive video or a digital video stream and data directly from main facility 102 (FIG. 1). In some embodiments, user television equipment 122 may receive non-on-demand media data from non-on-demand media data source 124
30 (FIG. 1), on-demand data from on-demand media data source 128 (FIG. 1), or any combination thereof. In still other embodiments, non-on-demand media data, on-demand media data, or a combination thereof may be

transmitted from a plurality of media data sources to distribution facility 116 (FIGS. 2-6), which may transmit the non-on-demand data and the on-demand data to user equipment 122.

5 **[0053]** During normal television viewing, a user may tune set-top box 202 to a desired television channel. The signal for that television channel may then be provided at video output 218. The signal supplied at output 218 is typically either a radio-frequency (RF)
10 signal on a predefined channel (e.g., channel 3 or 4), or an analog demodulated video signal, but may also be a digital signal provided to television 212 on an appropriate digital bus (e.g., a bus using the Institute of Electrical and Electronics Engineers
15 (IEEE) 1394 standard (not shown)). The video signal at output 218 may be received by optional secondary storage device 210.

20 **[0054]** The interactive television application may run on set-top box 202, television 212 (if television 212 has suitable processing circuitry and memory), a suitable analog or digital receiver connected to television 212, or digital storage device 208 if digital storage device 208 has suitable processing circuitry and memory. The interactive television
25 application may also run cooperatively on a suitable combination of these devices. Interactive television application systems in which a cooperative interactive television program guide application runs on multiple devices are described, for example, in Ellis U.S.
30 patent application Serial No. 09/186,598, filed November 5, 1998, which is hereby incorporated by reference herein in its entirety.

[0055] Secondary storage device 210 may be any suitable type of analog or digital program storage device or player (e.g., a videocassette recorder (VCR), a personal video recorder (PVR), a digital versatile disc (DVD) player, etc.). Program recording and other features may be controlled by set-top box 202 using control path 216. If secondary storage device 210 is a videocassette recorder or a personal video recorder, for example, a typical control path 216 may involve the use of an infrared transmitter coupled to the infrared receiver in the recorder that normally accepts commands from a remote control such as remote control 214. Remote control 214 may be used to control set-top box 202, secondary storage device 210, and television 212.

15 [0056] At least a portion of on-demand data may be cached in memory 204. In some embodiments, non-on-demand media data and other application data may also be cached in memory 204.

[0057] If desired, a user may record programming (e.g., movies, television programs, sporting events, any combination thereof, etc.) in digital form on digital storage device 208. Digital storage device 208 may be a writeable optical storage device (such as a DVD player capable of handling recordable DVD discs), a magnetic storage device (such as a disk drive or digital tape), or any other digital storage device. Interactive television program guide systems that have digital storage devices are described, for example, in Hassell et al. U.S. patent application Serial No. 09/157,256, filed September 17, 1998, which is hereby incorporated by reference herein in its entirety. Digital storage device 208 may cache on-demand media data.

[0058] Digital storage device 208 may be contained in set-top box 202 or it can be an external device connected to set-top box 202 via an output port and appropriate interface. If necessary, processing
5 circuitry in set-top box 202 formats the received video, audio and data signals into a digital file format. The file format may be an open file format such as the Moving Picture Experts Group (MPEG) MPEG-2 standard or the Moving Joint Photographic Experts Group
10 (MJPEG) standard. The resulting data may be streamed to digital storage device 208 via an appropriate bus (e.g., a bus using the Institute Electrical and Electronics Engineers (IEEE) 1394 standard), and stored on digital storage device 208. In another suitable
15 approach, an MPEG-2 data stream or series of files may be received from distribution equipment 122 (FIGS. 2-6) and stored.

[0059] Television 212 may receive video signals from secondary storage device 210 via communications path
20 220. The video signals on communications path 220 may either be generated by secondary storage device 210 when playing back a prerecorded storage medium (e.g., a videocassette or a recordable digital video disc), by digital storage device 208 when playing back a
25 pre-recorded digital medium, may be passed through from set-top box 202, may be provided directly to television 212 from set-top box 202 if secondary storage device 210 is not included in user television equipment 122 (FIGS. 2-5), or may be received directly by television
30 212. During normal television viewing, the video signals provided to television 212 may correspond to the desired channel to which a user has tuned with set-top box 202. Video signals may also be provided to

television 212 by set-top box 202 when set-top box 202 is used to play back information stored on digital storage device 208.

[0060] Set-top box 202 may have memory 204. Memory
5 204 may be any memory or other storage device, such as a random access memory (RAM), read only memory (ROM), flash memory, a hard disk drive, a combination of such devices, or any memory suitable for storing application instructions and application data for use by the
10 interactive application. At least a portion of non-on-demand data, on-demand data, or a combination thereof may be automatically cached in memory 204. Caching on-demand media data may reduce or eliminate the latency in displaying on-demand media data on television 212,
15 and may reduce the resource load of a distribution network, depending on the chosen system implementation.

[0061] Set-top box 202 may have communications device 206 for communicating directly with distribution equipment 118 (FIGS. 2-6), server 132 (FIGS. 3 and 5)
20 Internet service system 134 (FIGS. 4-6) or, in some embodiments, non-on-demand media data source 124 (FIG. 1) or on-demand media data source 128 (FIG. 1), over a suitable communication paths. Communications device 206 may be a modem (e.g., cable modem, telephone modem,
25 digital subscriber line (DSL) modem, integrated service digital network (ISDN) modem, or any suitable analog or digital modem), network interface card (e.g., an Ethernet card, etc.), or other suitable communications device. Communications device 206 may also be a
30 personal computer with an Internet connection in, for example, the arrangement shown in FIG. 6. Television 212 may also have such a suitable communications device if desired. In an alternative approach, user

television equipment 122 (FIGS. 4-5) may communicate with Internet service system 134 (FIGS. 4-5) via distribution equipment 118 using a suitable return path.

5 [0062] FIG. 8 is a illustrative schematic block diagram of portions of the user television equipment of FIG. 7, in accordance with various embodiments of the present invention. Application data 200 from distribution facility 116 (FIGS. 2-6) may be received
10 by control circuitry 300 of user television equipment 122 (FIGS. 2-5) or personal computer 140 (FIG. 6). The functions of control circuitry 300 may be integrated into an advanced television receiver, personal computer television (PC/TV), or any other suitable arrangement.
15 If desired, a combination of such arrangements may be used.

[0063] User television equipment 122 of FIG. 8 may also have digital storage device 312 and secondary storage device 314 for recording media. Secondary
20 storage device 314 may be any suitable type of analog or digital program storage device (e.g., a videocassette recorder (VCR), a personal video recorder (PVR), a digital versatile disc (DVD), etc.). Program recording and other features may be controlled by
25 control circuitry 300. Digital storage device 312 may be, for example, a writeable optical storage device (such as a DVD player capable of handling recordable DVD discs), a magnetic storage device (such as a disk drive or digital tape), or any other digital storage
30 device. In some embodiments, digital storage device 312 may cache on-demand media data.

[0064] User television equipment 122 may also have memory 302. Memory 302 may be any memory or other

storage device, such as a random access memory (RAM), read only memory (ROM), flash memory, a hard disk drive, a combination of such devices, etc., that is suitable for storing application instructions and application data for use by control circuitry 300. Memory 302 may also store cached on-demand media data for use by the interactive television application.

[0065] User television equipment 122 of FIG. 8 may also have communications device 310 for supporting communications between equipment 122 and distribution equipment 118 (FIGS. 2-6), server 132 (FIGS. 3 and 5), Internet service system 134 (FIGS. 4-6) or, in some embodiments on-demand media data source 124 (FIG. 1) or non-on-demand media source 128 (FIG. 1) via suitable communication paths. Communications device 310 may be a modem (e.g., a cable modem, digital subscriber line (DSL) modem, telephone modem, integrated services digital network (ISDN) modem, or any suitable analog or digital modem), network interface card (e.g., an Ethernet card, Token ring card, etc.), or other suitable communications device.

[0066] A user may control the operation of user television equipment 122 with user input device 304. User input device 304 may be a pointing device, wireless remote control, keyboard, touch-pad, voice recognition system, or any other suitable user input device. To watch television, a user instructs control circuitry 300 to display a desired television channel on display device 308. Display device 308 may be any suitable television, monitor, or other suitable display device. To access the functions of the application, a user may instruct the application to generate a main menu or other desired display for display on display

device 308. To access sound, a user may instruct control circuitry 300 to provide audio media on audio device 306. Audio device 306 may be part of display device 308, or may be separate.

5 [0067] FIG. 9 is a flow diagram illustrating process 400 for retrieving and caching data from multiple data sources in accordance with certain aspects of the present invention. As shown, non-on-demand data may be retrieved from a non-on-demand media data source at
10 step 402. For example, in some embodiments an interactive television application may retrieve non-on-demand data from non-on-demand media data source 124 (FIG. 1) directly or via distribution facility 116 (FIGS. 2-6) and suitable communications paths. It may
15 not be necessary for user equipment 122 (FIGS. 2-5) or personal computer 140 (FIG. 6) to request non-on-demand data from a data source. Rather, a non-on-demand media data source may periodically send non-on-demand data to user television equipment 122 (FIGS. 2-5) or personal
20 computer 140 (FIG. 6). In some embodiments, non-on-demand data may also be stored in cache memory.

[0068] On-demand media data may be automatically retrieved from an on-demand media data source at step 404. For example, user television equipment 122 may
25 retrieve on-demand data from non-on-demand media data source 124 (FIG. 1) directly or via distribution facility 116 and suitable communications paths. It may not be necessary for user equipment 122 to request on-demand data from a data source. Rather, an on-demand
30 media data source may periodically send on-demand data to user television equipment 122 or distribution facility 116.

[0069] The on-demand media data may be automatically cached on user television equipment after retrieval from the on-demand media data source at step 406. On-demand media information may be cached, for example, in
5 memory 204 (FIG. 7) or memory 302 (FIG. 8) or digital storage device 208 or 312. Caching the on-demand media data may be staggered in time among users to lessen the peak loads on the network which distributes the on-demand media data. For example, distribution facility
10 116 (FIGS. 2-6) may distribute cache schedules from non-on-demand media data source 124 (FIG. 1) or on-demand media data source 128 (FIG. 1) to user television equipment 122 (FIGS. 2-5) or personal computer 140 (FIG. 6) that indicate to the interactive
15 television application when on-demand media data is to be cached. In some embodiments, on-demand media data may be predictively cached in order to further reduce latencies. For example, on-demand media data which is commonly accessed, or which is likely to be accessed by
20 the user, such as features accessible to a user from a given display, may be cached. In other approaches, the most popular media on demand data may be cached. In still other approaches, the data that is cached may be personalized. For example, user activity may be
25 monitored and the on-demand media may be cached based on the user history. Any other suitable predictive caching may be used.

[0070] At step 408, the on-demand media data may be retrieved from cache and displayed in response to a
30 user indication to access at least the on-demand media. For example, on-demand media data may be provided in a display with only on-demand media data, such as a video-on-demand listings display. In other approaches,

on-demand media data may be displayed with non-on-demand media data, other application data, or any suitable combination thereof.

[0071] Non-on-demand media data may be displayed in response to a user indication to access at least the non-on-demand data at step 410. For example, non-on-demand media data may be provided in a display with only non-on-demand media data, such as a television program listings display. In other approaches, non-on-demand media data may be displayed with on-demand media data, other application data, or any suitable combination thereof.

[0072] FIGS. 10-11 are flow diagrams illustrating process 500 for providing non-on-demand data and on-demand data in accordance with various embodiments of the present invention. Display television program step 502 may display television programming, for example, on user television equipment 122 (FIGS. 2-5) or personal computer 140 (FIG. 6). In some embodiments, equipment 122 (FIGS. 2-5) may continually check for user input (e.g., commands from remote control 214 illustrated in FIG. 7). View media information test 504 may determine whether a user has indicated to have the interactive television application display media information. Media information may be non-on-demand media offerings, on-demand media offerings, a combination thereof, or any suitable media information. If the user does not select to enter the interactive television application, the television program will continue to be displayed at step 502. If the user does select an option to view media information at test 504, an interactive television application menu may be displayed (e.g., display 600 illustrated in FIG. 12).

[0073] After a user has selected to view media information, test 506 may determine whether the corresponding media data is located in the cache of the interactive television application system (e.g.,
5 memory 204, digital storage device 208, secondary storage device 210, etc. illustrated in FIG. 7). In some embodiments, the media data stored in cache may be on-demand media data. If the requested data is not in the cache, step 512 may determine whether a connection
10 exists between the interactive television application system (e.g., user television equipment 122 illustrated in FIGS. 2-5) and a data source (e.g., distribution facility 116, non-on-demand media data source 124, on-demand media data source 128, etc. illustrated in FIGS.
15 1-6) that may provide the requested media data. If it is determined at test 506 that the requested media data is in cache, the data may be retrieved at step 508. In some embodiments, media data that is commonly accessed, or likely to be accessed, may be cached to minimize
20 latency in displaying the media data and reducing the load on transmission system resources. For example, on-demand media data for features accessible to a user from a given display may be cached. In other approaches, the most popular media on demand data may
25 be cached. In still other approaches, the data that is cached may be personalized. For example, user activity may be monitored and the on-demand media may be cached based on the user history. Any other suitable predictive caching may be used.

30 [0074] Next, test 510 may determine whether it is necessary to retrieve additional media data from a data source (e.g., non-on-demand media data source 124 or on-demand media data source 128 (FIG. 1)) in order to

display the media data requested by the user. In some embodiments, the media data to be retrieved may be on-demand media data. In some embodiments, media data that is commonly accessed, or likely to be accessed, may be retrieved to minimize latency in the display of media data. If it is determined that media data does not need to be retrieved, the requested media data (e.g., television program listings, video-on-demand listings, interactive video game listings, audio-on-demand listings, weather information, etc.) may be displayed or otherwise provided to the user at step 518.

[0075] If it is determined that media data needs to be retrieved from a data source, test 512 may determine whether a connection between the interactive television application system (e.g., user equipment 122 illustrated in FIGS. 2-5, personal computer 140 illustrated in FIG. 6, etc.) and a data source (e.g., on-demand media data source 128 of FIG. 1) has been established. A connection may be established at step 514 if there is no pre-existing connection. In some embodiments, communications device 206 (FIG. 7) may be used to establish a connection between user television equipment 122 and distribution facility 116 via a suitable communications path. After a connection has been established at step 514, media information may be retrieved from a data source at step 516 (FIG. 11), and displayed at step 518 (FIG. 11). In some embodiments, the retrieved information may be on-demand media data.

[0076] Test 520, as illustrated in FIG. 11, may continually check whether the user would like to return to the television program. In some embodiments, user television equipment 122 (FIGS. 2-5) may receive a user

indication to return to television programming from remote control 214 as illustrated in FIG. 7. If the user does not wish to return to the television program, the media information may continue to be displayed at step 518. If the user does select to return to television programming, the television program may be displayed at step 522. In some embodiments, media information and television programming may be displayed at the same time.

10 **[0077]** FIG. 12 shows an illustrative a menu display 600 for an interactive guidance application in accordance with one embodiment of the present invention. As shown, display 600 may include panel advertisements 602, banner advertisement 604, viewer services options 606, program listings options 608, cable showcase options 610, and highlight region 612.

15 **[0078]** Panel advertisements 602 may be used to advertise, for example, programs, products or promotions to a user. In some embodiments, users may select panel advertisements 602 in order to obtain more information regarding the program, product or promotional offer. In some embodiments, advertisements 602 may also be targeted, for example, towards a user's viewing habits, selections, purchases, or by using any suitable targeting criteria. Panel advertisements may appear in displays illustrated in FIGS. 12-19.

20 **[0079]** Banner advertisement 604 may be used to advertise, for example, a special event or promotion. In some embodiments, users may select banner advertisement 604 in order to obtain more information regarding the special event or promotion. In some embodiments, advertisement 604 may also be targeted, for example, towards a user's viewing habits,

selections, purchases, or by using any suitable targeting criteria. Banner advertisements may appear in displays illustrated in FIGS. 12-19.

[0080] In response to a user selecting an

- 5 advertisement 602 or 604 that promotes non-on-demand media or products, the interactive application may, for example, retrieve information for the program or product from memory by establishing a client/server session between user equipment 122 and non-on-demand
- 10 media data source 122 (FIG. 1). In response to a user selecting an advertisement 602 or 604 that promotes on-demand media, the interactive application may, for example, determine whether data for the advertised on-demand media has been cached and, if so, retrieve
- 15 information for the on-demand media from cache and provide it in a suitable display. When data for the advertised on-demand media is not cached, the interactive television application may, for example, establish a client/server session between user
- 20 equipment 122 and on-demand media data source 122 (illustrated in FIG. 1) and retrieve data for display. The data for the on-demand media may have been cached based on a schedule for displaying the advertisement, may have been cached at the time the advertisement was
- 25 displayed and made available for user selection, or based on any other suitable criteria.

- [0081] Display 600 may also contain viewer services options 606. Suitable viewer services options 606 may include an option to access features or information of
- 30 a personal video recorder, an option to access messages (e.g., e-mail messages, messages provided from television system service provider, etc.), an option to adjust parental control settings (e.g., blocked

channels or ratings, etc.), an option to set favorites (e.g., favorite channels, etc.), an option to set up the program guide or user equipment, an option to exit display 600, or any suitable option.

5 [0082] Display 600 may also contain program listings options 608. Options 608 may include an option to view program listings organized by time, organized by channel, organized by genre (e.g., sports, children, etc.), or by any other suitable organization. Options
10 608 may also include an option to search for programs of interest (e.g., using keywords, based on a title search, based on an actor search, etc.).

[0083] Cable showcase options 610 may include, for example, video-on-demand program listings option, pay-
15 per-view program listings option, pay-per-view event listings option, premium channel listings option, music channel listings option, adult program listings option, or any other suitable options.

[0084] Highlighted region 612 may be used to
20 indicate a user's selection of an option in screen 600. In some embodiments of the invention, set top box 202 (FIG. 7) may receive a user command from remote control 214 (FIG. 7) to move highlighted region 612 within display 600 or within any of the displays illustrated
25 in FIGS. 12-20.

[0085] In response to a user selecting the VOD (video-on-demand) option shown in display 600 of FIG. 12, the interactive guidance application may present the user with a display such as display 620 of FIG. 13.
30 As shown, VOD display 620 may include various options that allow the user to view VOD program listings organized by different genres. The genre options may include: alphabetical movies listings option 622, new

releases option 624, specials option 626, cable picks option 628, coming soon option 630, movie saver option 632, adults only option 634, family option 636, action option 638, drama option 640, comedy option 642, kids option 644, thrillers option 646, classics option 648, or any other suitable option. In some embodiments, the different genre options may be on-demand media data retrieved and cached from an on-demand data source (e.g., on-demand media data source 128 illustrated in FIG. 1). For example, the labels for display options and other related information may be cached when the user accesses display 600 (FIG. 12) or selects VOD option 612 (FIG. 12) or periodically or at other suitable times.

15 [0086] In response to the user selecting alphabetical movie listings option 622 of display 620 for example, the interactive television application may present display 650 of FIG. 14 in which video-on-demand options are listed alphabetically. As shown, display 20 650 may include alphabetical range display area 652, alphabetical range arrows 654, list arrows 656, movie listings 658, and highlighted region 660. During display generation, the interactive television application may examine its cache (e.g., memory 204 25 (FIG. 7) or memory 302 (FIG. 8)) to determine whether the necessary on-demand media data, in this example video-on-demand titles, has been cached. For example, if alphabetical movie title data is commonly accessed, or likely to be accessed, the interactive television 30 application system may have retrieved and cached the data automatically when the user accessed display 620 (FIG. 13). In another example, the system may cache the first few titles (e.g., one page of listings) in

each alphabetical range. When the data has been cached, the interactive television application may retrieve the information for display. Otherwise, the interactive television application may retrieve the on-demand media data from an on-demand media data source (e.g., on-demand media data source 128 (FIG. 1)).

[0087] The alphabetical range of movies covered by display 650 may be shown in region 652. In some embodiments, only a portion of the offerings for video-on-demand may be shown on display 650 as indicated by arrows 654. In some embodiments, set-top-box 202 (FIG. 7) may receive a user command from remote control 214 (FIG. 7) to navigate forwards or backwards in the alphabetical list. Similarly, set-top box 202 may receive a user command from remote control 214 to navigate through video-on-demand movie listings 658 of FIG. 14. In some embodiments, the system may retrieve and cache detailed information for each of the titles on the display, each time the display is updated to show a different set of on-demand titles. This may allow the system to display detailed information about the selection when the user selects it, without having to wait for data to be retrieved from on-demand media source.

[0088] The user may select an individual video-on-demand movie title from video-on-demand movie listings 658 using highlighted region 660. In some embodiments, a display for an individual video-on-demand movie, such as display 760 illustrated in FIG. 15, may be presented to the user. Display 670 of FIG. 15 may include title 672, which may be the title of the selected video-on-demand listing. Rating 674 may indicate to the user the rating for the selected video-on-demand movie

(e.g., G, PG, PG-13, R, etc.). Run-time 676 may indicate the length of the video-on-demand selection in, for example, hours and minutes. Cost 678 may indicate the cost in viewing the video-on-demand selection. In some embodiments, a user may accept the costs and view the selected video-on-demand title by selecting yes button 680. Alternatively, the user may decline ordering the video-on-demand title by selecting no button 682. In some embodiments, the user may select an option to preview the video-on-demand selection (e.g., view a clip, trailer, or other promotional video segment) before making a purchasing decision. Information area 684 may provide information related to the video-on-demand selection, including the title, release date, rental period, viewing period, movie summary, actor/actress names, producer names, production studio name, or any other suitable information. In some embodiments, the information presented in display 670 may be retrieved from cache, such that the information related to the selection may be presented when the user selects it. The title, rating, cost, run-time, release date, rental period, viewing period, movie summary, actor/actress names, producer names, production studio name, or any other suitable information may be previously stored in cache and retrieved for display upon indication by the user to view an individual video-on-demand selection. Thus, the user may not experience delays that may be associated with having to retrieve the data from a on-demand media data source.

[0089] In some embodiments, the interactive television application system may combine video-on-demand program listings with television program

listings on the same display. In display 700 of FIG. 16, for example, program listings 702 may be organized by time. The interactive television application may present display 700 in response to, for example, the user selecting the by time option from program listings options 608 (FIG. 12). During display generation process, the interactive television application may examine its cache (e.g., memory 204 (FIG. 7) or memory 302 (FIG. 8)) to determine whether the necessary on-demand media data, in this example video-on-demand titles 704, has been cached. For example, if listings for particular time slots are commonly accessed, or likely to be accessed, and if particular VOD titles are to be promoted for those time slots, the interactive television application system may have retrieved and cached the data automatically when the user accessed display 600 (FIG. 12) or when the user selected by time option 608 (FIG. 12) or at some previous time. When the data has been cached, the interactive television application may retrieve the information for display. Otherwise, the interactive television application may retrieve the on-demand media data from an on-demand media data source (e.g., on-demand media data source 128 (FIG. 1)). The non-on-demand media data for television program listings 706 may be retrieved from a non-on-demand media data source (e.g., non-on-demand media data source 124 (FIG. 1)).

[0090] In this example, non-on-demand program listings 706 correspond to programs that may be airing during the time indicated in area 708 (e.g., 12:30 PM in the example of FIG. 16). Arrows 710 may indicate to the user that program listings for other times may be available. In some embodiments, set-top box 202 (FIG.

7) may receive user commands from remote control 214 (FIG. 7) to scroll through listings offered at different times. Video-on-demand media indicated by program listings 704 may be available for on-demand viewing during the time indicated in area 708, or at any time in a true on-demand approach. The video-on-demand program listings may be provided in display 700 to promote these offerings.

[0091] More television program listings and video-on-demand program listings may be available than may fit on display 700. Arrows 712 may indicate to the user that more listings are available by scrolling. In some embodiments, set-top box 202 (FIG. 7) may receive user commands from remote control 214 (FIG. 7) to scroll through the list of program listings 702. As the user scrolls through additional pages of listings for a time period or to listings for other time periods, additional non-on-demand listings and on-demand listings may be retrieved from the cache or retrieved from a remote server.

[0092] When screen 700, or any other screen shown in FIGS. 12-20, is displayed, the interactive television application may continue to play the audio track from the currently tuned television program or other non-on-demand or on-demand media. Alternatively, the interactive television application may reduce the size of the video track, and show it at the same time as any of the display screens. In another alternative, on-demand data or non-on-demand data may be overlaid on top of the video track. Opening a session with the on-demand media server or other server may require the interactive television application to use the tuner in the set-top, thus losing the audio or video.

Therefore, it is highly desirable to retrieve data from the cache for the most common screens, and for any screens that simultaneously show video and listings. On screens that show both non-on-demand listings and

5 on-demand listings, the user may not expect to lose the video connection, and also may be less willing to experience a delay to retrieve on-demand listings.

[0093] FIG. 17 shows an illustrated interactive television application display 720 in which video-on-

10 demand program listings 724 and television program listings 726 may be organized by the sports genre in accordance with one embodiment of the present invention. The interactive television application may display display 720 in response to the user selecting

15 the sports option of program listings options 608 in display 600 of FIG. 12. During display generation process, the interactive television application may examine its cache (e.g., memory 204 (FIG. 7) or memory 302 (FIG. 8)) to determine whether the necessary on-

20 demand media data, in this example video-on-demand titles 724, has been cached. For example, if listings for sports media are commonly accessed, or likely to be accessed, the interactive television application system may have retrieved and cached the data automatically

25 when the user accessed display 600 (FIG. 12) or when the user selected sports option 608 (FIG. 12) or at other earlier time. When the data has been cached, the interactive television application may retrieve the information for display. Otherwise, the interactive

30 television application may retrieve the on-demand media data from an on-demand media data source (e.g., on-demand media data source 128 (FIG. 1)). The non-on-demand media data for television program listings 726

may be retrieved from a non-on-demand media data source (e.g., non-on-demand media data source 124 (FIG. 1)) or the local cache.

[0094] Arrows 730 may indicate that a user may
5 scroll through times to view program listings. In some embodiments, set-top box 202 (FIG. 7) may receive user commands from remote control 214 (FIG. 7) to scroll through program listings 722 for different times. In some embodiments, display 720 may not display all of
10 the available television program listings 726 and video-on-demand listings 724. As indicated by arrows 732, a user may scroll through sports listings 722 for a given time displayed in time area 728. In some embodiments, set-top box 202 (FIG. 7) may receive user
15 commands from remote control 214 (FIG. 7) to scroll through program listings 722.

[0095] FIG. 18 shows an illustrative interactive television application display 750 in which video-on-demand program listings 754 and television program
20 listings 756 of combined listings 752 are organized by the movie genre in accordance with one embodiment of the present invention. The interactive television application may provide display 750 in response to, for example, the user selecting the movies option from
25 program listings option 608 of display 600 of FIG. 12. During display generation process, the interactive television application may examine its cache (e.g., memory 204 (FIG. 7) or memory 302 (FIG. 8)) to determine whether the necessary on-demand media data,
30 in this example video-on-demand titles 754, has been cached. For example, if listings for movies are commonly accessed, or likely to be accessed, the interactive television application system may have

0097466 100001 99942660

retrieved and cached the data automatically when the user accessed display 600 (FIG. 12) or when the user selected movie option 608 (FIG. 12) or at other earlier time. When the data has been cached, the interactive television application may retrieve the information for display. Otherwise, the interactive television application may retrieve the on-demand media data from an on-demand media data source (e.g., on-demand media data source 128 (FIG. 1)). The non-on-demand media data for television program listings 756 may be retrieved from a non-on-demand media data source (e.g., non-on-demand media data source 124 (FIG. 1)) or from the cache.

[0096] Combined listings 752 may be organized according to time. Area 758 may indicate the time that programs in combined listings 752 may be aired. Arrows 760 may indicate a user may scroll through times in order to view combined listings for different times. In some embodiments, set-top box 202 (FIG. 7) may receive user commands from remote control 214 (FIG. 7) to view combined listings 752 for different times indicated in area 758. In some embodiments, all available television program listings 756 and video-on-demand listings 754 may not be shown on display 750 for a given time shown in area 758. Arrows 762 may indicate that more listings are available. In some embodiments, set-top box 202 (FIG. 7) may receive user commands from remote control 214 (FIG. 7) to scroll through combined listings 752.

[0097] FIG. 19 shows an illustrated interactive television application display 800 in which video-on-demand program listings 804 and television program listings 806 of combined listings 802 are organized by

the children's genre in accordance with one embodiment of the present invention. The interactive television application may provide display 800 in response to, for example, a user selecting the children's genre option from program listings option 608 of display 600 of FIG. 12. During display generation process, the interactive television application may examine its cache (e.g., memory 204 (FIG. 7) or memory 302 (FIG. 8)) to determine whether the necessary on-demand media data, in this example video-on-demand titles 804, has been cached. For example, if listings for children's programming are commonly accessed, or likely to be accessed, the interactive television application system may have retrieved and cached the data automatically when the user accessed display 600 (FIG. 12) or when the user selected children option 608 (FIG. 12) or at other earlier time. When the data has been cached, the interactive television application may retrieve the information for display. Otherwise, the interactive television application may retrieve the on-demand media data from an on-demand media data source (e.g., on-demand media data source 128 (FIG. 1)). The non-on-demand media data for television program listings 806 may be retrieved from a non-on-demand media data source (e.g., non-on-demand media data source 124 (FIG. 1)) or from the cache.

[0098] Combined listings 802 may be organized according to time. Area 808 may indicate the time that the combined listings 802 shown in display 800 may be aired. Arrows 810 may indicate a user may scroll through times to view different combined listings. In some embodiments, set-top box 202 (FIG. 7) may receive user commands from remote control 214 (FIG. 7) to

scroll through times in area 808 to view different combined listings. In some embodiments, arrows 812 may indicate that additional television programs and video-on-demand listings may be viewed by a user. In some
5 embodiments, set-top box 202 (FIG. 7) may receive user commands from remote control 214 (FIG. 7) to scroll through program listings 802.

[0099] The listings in the displays (e.g., displays illustrated in FIGS. 12-20) provided by the interactive
10 television application system may be color-coded or otherwise visually distinguished to clarify what type of programming is being offered. For example, in display 800 of FIG. 19, video-on-demand options 804 may be colored in red to indicate the options are movies
15 and television program options 806 may be displayed in orange to indicate that the options are regular children's television programs.

[0100] FIG. 20 shows illustrates a recommended viewing display 820 that may be provided to promote
20 video-on-demand programs and television programs in accordance with one embodiment of the present invention. The interactive television application may provide a display such as display 820 of FIG. 20 in response to, for example, a user selecting cable picks
25 option 628 of FIG. 13. During display generation process, the interactive television application may examine its cache (e.g., memory 204 (FIG. 7) or memory 302 (FIG. 8)) to determine whether the necessary on-demand media data, in this example video-on-demand
30 titles, has been cached. For example, if listings for cable picks are commonly accessed, or likely to be accessed, the interactive television application system may have retrieved and cached the data automatically

when the user accessed display 620 (FIG. 13) or when the user selected cable picks option 628 (FIG. 13) or at some other previous time. When the data has been cached, the interactive television application may
5 retrieve the information for display. Otherwise, the interactive television application may retrieve the on-demand media data from an on-demand media data source (e.g., on-demand media data source 128 (FIG. 1)). The non-on-demand media data for television program
10 listings may be retrieved from a non-on-demand media data source (e.g., non-on-demand media data source 124 (FIG. 1)) or from the cache.

[0101] Display 820 of FIG. 20 may contain cable picks options 822, which is are listings for
15 programming that is being promoted by the operator of a distribution facility (e.g., distribution facility 116 illustrated in FIGS. 2-6) or other suitable entity. The operator may desire to promote popular video-on-demand offerings, programs on premium channels, pay-
20 per-view programming, special events, regular television programs, or any suitable programming.

[0102] Combined listings 822 may be organized according to time. Area 826 may indicate the time for listings 822. Arrows 828 may indicate a user may
25 scroll though times to view different combined listings. Arrows 830 may indicate that more listings are available than are shown on display 820. In some embodiments, set-top box 202 (FIG. 7) may receive user commands from remote control 214 (FIG. 7) to scroll
30 through combined listings 822 with highlighted region 824.

[0103] Icons may be provided on the listings in any of the listings screens illustrated in FIGS. 12-20. As

09574666-100001

illustrated in FIG. 20, a check icon 832 may be used to indicate that a pay-per-view program has been ordered or that a reminder has been set for a non-pay-per-view program. As illustrated in FIG. 20, a check icon may
5 be used to indicate that a video-on-demand program has been purchased. Lock icon 834 may be used to indicate when a program has been blocked using the program guide's parental control functions. When the user selects Search from the Program Listings options 608 on
10 display 600 of Fig. 12, the interactive television application may allow the user to perform a search of program listings based on keywords, program title, actors, etc. The interactive television application may search both non-on-demand data and on-demand data
15 for media that matches the specified search criteria. The results of both searches may be combined in a single screen, and titles for both types of media may be intermixed. If desired, the interactive television application may limit the search to only data that is
20 currently cached, to allow a quicker search. Alternatively, the user may be given the option to either search only the cache or to search all data available from the cache, the on-demand server, and the non-on-demand server.

25 [0104] Thus, it is seen that systems and methods for retrieving non-on-demand and on-demand media data have been provided. Persons skilled in the art will appreciate that the present invention can be practiced by other than the described embodiments, which are
30 presented for the purposes of illustration rather than of limitation, and the present invention is limited only by the claims which follow.
